-!- PATHWAY Anaerobic glycolysis; final step.
-!- PATHWAY Anaerobic glycolysis; final step.
-!- SUBUNIT: Homotetramer (By similarity).
-!- SIMILARITY: Belongs to the LDH/MDH superfamily. LDH family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MEDLINE=96123406; PubMed=8577343; DOI=10.1016/0166-6851(95)00069-D;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | REMBL, U23307; AAC46863.1; -; mRNA. |

Submitted (NOV-1997) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Catalyzes the reversible oxidation of malate to oxaloacetate (By similarity).

-!- CATALYTIC ACTIVITY: (S)-malate + NAD(+) = oxaloacetate + NADH.

-!- SIMILARITY: Belongs to the LDH/MDH superfamily. MDH type 3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

-!- CATALYTIC ACTIVITY: (S)-malate + NAD(+) = oxaloacetate + NADH.
-!- SIMILARITY: Belongs to the LDH/MDH superfamily. MDH type 3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Proton relay (By similarity).

"The louse-borne human pathogen Bartonella quintana is a genomic derivative of the zoonotic agent Bartonella henselae.";
Proc. Natl. Acad. Sci. U.S.A. 101:9716-9721(2004).
-!- FUNCTION: Catalyzes the reversible oxidation of malate to oxaloacetate (By similarity).
-!- CATALYZIC ACTIVITY: (S)-malate + NAD(+) = oxaloacetate + NADH.
-!- SIMILARITY: Belongs to the LDH/MDH superfamily. MDH type 3 family. 9 RPKIAMVGSGMIGGTMAFLCSLRELGDVVLFDVVPNMPMGKAMDISHNSSVVDTGITVYG | |||::||||||||:|| | RKKIALIGSGMIGGTLAHMIGLKELGDVVLPDIEEGMPQGKALDIAESSPVDGFDVSLTG 129 NITNPLDVMVAALQESSGLPHHRICGMAGMLDSSRFRRMIADKLEVSPRDVQGMVIGVHG DHMVPLSRYATVNGIPLSEFVKKGWIKQEEVDDIVQKTKVAGGEIVRLLGQGSAYYAPGA EMBL; BX897700; CAF26803.1; -; Genomic_DNA.

CATALYTIC ACTIVITY: (S)-malate + NAD(+) = oxaloacetate + NADH.

SIMILARITY: Belongs to the LDH/MDH superfamily. MDH type 3 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Halling S.M., Peterson-Burch B.D., Bricker B.J., Zuerner R.L., Olog Z., Li L.L., Kapur V., Alt D.E., Olsen S.C.; "Completion of the genome sequence of Brucella abortus and comparison to the highly similar genomes of Brucella melitensis and Brucella

Scoring table:

The 37 kba lactate dehydrogenase (LDH) (AAW11476) of Eimeria acervulina schizonts, or immunologically active portions of it, can be used for prodn. of vaccines against coccidiosis in poultry. The LDH can be isolated from schizonts or produced in host cells or organisms transformed with recombinant vectors including LDH nucleic acids (see also AAT51370). Live viral vaccines can also be produced. (Updated on 17-0CT-2003 to standardise OS field) Eimeria lactate dehydrogenase protein - used for prodn. of vaccines against coccidiosis in poultry. Lactate dehydrogenase; LDH; coccidiosis; vaccine; vector. Sequence 330 AA;

Length 330;

Score 1685; DB 2; Pred. No. 1.5e-158;

berging an improved property comprises transforming a plant with the recombinant DNA construct and growing the transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polymentide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to harbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or conditions increased rate of providing improved plant growth and development under at least one stress condition, improved lighin production or improved galactomannan condition, improved lighin production or improved galactomannan condition, improved lighin production or improved galactomannan condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       128

                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant is a crop plant such as maize or soybean. The method of producing a transformed plant the having an improved property comprises transforming a plant with the cecombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with congrance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the content, improved yield by modification of carbohydrate, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved lighin production of photosynthesis or by production, improved lighin production or improved galactonannan condition, improved specification of condition this patent did not form part of the printed specification but was obtained in electronic form part of the printed specification but was obtained in electronic condition.
                                                                                                                                                                                                                                                                                                                                                                               promoter positioned to provide g a polypeptide from a

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polymotlectide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant such as maize or soybean. The method of producing a transformed plant such as mirroved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polymotlectide or polypeptide is useful for improving plants with the recombinant DNA construct is useful for improving plants with the compression properties. The recombinant properties, extreme commotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan

having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plant properties.

The recombinant DNA construct is useful for producing plants with recombinant DNA construct is useful for producing plants with construct is useful for producing plants with construct is useful for producing plants with construct is useful for producing plants with construct of the call cycle pathway with plant growth requisors, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the cope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ή,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a recombinant DNA construct comprising a promoter in unit of a plant cell, where the promoter is positioned to provide for expression of a polymuclectide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant encomprising the recombinant DNA construct and a method of producing a transformed plant transformed plant having an improved property. The plant is a crop plant ench as maize or soybean. The method of producing a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                68
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       62
New recombinant DNA construct comprising a promoter positioned to provi
for expression of a polynucleotide encoding a polypeptide from a
microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9 RPKIAMVGSGMIGGTMAFLCSLRELGDVVLFDVVPNMPMGKAMDISHNSSVVDTGITVYG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        3 RKKIALIGSGMIGGTLAHLASLKELGDIVLFDIADGIPQGKGLDIAQSGPVEGFNAKLSG

promoter functional in a plant cell, where the promoter is positioned to promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant cell invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct. The method of producing a plant with the recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. The recombinant DNA construct is useful for improving plant properties. Compression of the cell cycle pathway with plant growth regulators, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved ylated by modification of caphohydrate, introgen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved plant production of improved glant condition or improved glant condition or production. This sequence represents a bacterial polypeptide used in the scome of the printed specification but was obtained in electronic form at each at each at a serial and the printed specification or improved plant in electronic form at each at a serial and the conditions the printed specification and the printed specification and the printed specification and the printed specification and the printed specification and the printed specification and the printed specification and the printed specification and the printed specification and the printed specification and the printed specification and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polymucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant The invention relates to a recombinant DNA construct comprising a Claim 1; SEQ ID NO 12060; 122pp; English.

```
increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to promoter. The invention all solutions are considered for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a tuch as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for improving plants with the recombinant brok construct is useful for improving plants with improved plant properties, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth rate by modification conditions in property of the cell cycle pathway with plant growth rate by modification the compliant improved yield by modification of carbohydrate, increased rate of content, improved yield by modification of carbohydrate, introgen or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ä
                                                                                                                                                                         New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lighth production or improved galactomanan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic former from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           128
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    117
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  129 NITNPLDVMVAALQESSGLPHHRICGMAGMLDSSRFRRMIADKLEVSPRDVQGMVIGVHG 100

promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant thaving an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant where the combinant DNA construct and growing the transformed plant where the polynucleotide or polypeptide is useful for improving plants with the recombinant DNA construct is useful for improving plants with improved plant properties. The recombinant DNA construct is useful for improving plant properties. C increased to herbicides, extreme osmotic conditions, pathogens or pests, increased resistence to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                        Recombinant DNA construct, transformed plant, improved plant property; cold tolerance; heat tolerance; drought tolerance; herbicide; osmosis; pathogen tolerance; pset tolerance; plant disease resistance; cell cycle pathway modification; plant growth regulator; homologous recombination; seed oil yield; protein yield; carbohydrate; nitrogen; phosphorus; photosynthesis; lignin; galactomannan; bacterial polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a recombinant DNA construct comprising

New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

Claim 1; SEQ ID NO 10523; 122pp; English.

ø The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned t provide for expression of a polynucleotide encoding a polypeptide from microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a

```
such as malze for solbsan. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transforming a plant where the polynuclectide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the call cycle pathway with plant growth regulators, increased rate of homologous recombination, modification of carbohydrate, increased rate of phosphorus use and/or uptake, by modification of photosynthesis or by
                                                                                                                                                                                                                                  providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SNSYECLKGADVVIITAGITKIPGKSDKEWSRMDLLPVNIKIMREVGAAIKSYCPNAFVI 128

```
This sequence represents P. falciparum lactate dehydrogenase (LDH). The Libr protein and immunogenic fragments of it may be used as an immunogen for antibody generation. The progress of immunisation can be monitored by detection of antibody tirres in plasma or serum. Antibodies raised against fragments of LDH can be used to immunise against P. falciparum infection and to detect early malarial infection. See also RR62606-14. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                    The present sequence represents a Plasmodium falciparum lactate dehydrogenase (LDH). The specification describes an antibody which binds to antigenic peptides derived from the LDH protein. The antibody can be used for diagnosing or treating malaria in a subject. The peptides and portions can be used for immunizing an individual against malaria and the antibody can also be used for diagnosing Plasmodium falciparum infections

promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant microbial source. The invention also relates to a transformed plant thaving an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant with the recombinant DNA construct is useful for improving plant with tolerance. The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, improved plant properties, e.g. improved cold, heat or drought tolerance, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TVYGSNSYECLKGADVVIITAGITKIPGKSDKEWSRMDLLPVNIKIMREVGAAIKSYCPN 124

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to prowoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant construct and growing the transforming a plant with the recombinant DNA construct and growing the transformed plant, where the colynucleotide or polypeptide is useful for improving plant properties. The recombinant DNA construct is useful for producing plant properties. The recombinant DNA construct is useful for producing plants with increased resistance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition. This sequence represents a bacterial polypeptide used in the growth part of the printed specification but was obtained in electronic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New recombinant DNA construct comprising a promoter positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source, useful for producing plants with improved properties.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAR94013;
```

```
dehydrogenase (h-rWAD) activity. The protein has a residual activity after storage at 40 deg.C for 10 days of at least 60%, pref. 70% and esp. 90%. A reagent containing the h-rWAD protein, MADH and L- aspartic and alpha-ketoglutaric acid may be used for the determination of glutamine oxalo-transaminase (GGT) activity. The h- rWAD protein may be produced by transforming B. coli with the DNA encoding this protein and isolating the protein from the culture medium. (Updated on 16-OCT-2003 to standardise OS field)
